### InmiChess,

was a [WinBoard](#) compliant chess engine written by [Werner Inmann](#) in [C](#), also available as [MS-DOS](#) program with an own [GUI](#), and as native [ChessBase](#) engine. After inspirations from a [Donninger](#) article and [Steinwender's](#) and [Friedel's](#) book *Schach am PC* <sup>[1]</sup>, Werner started to write InmiChess in 1997. After implementing [alpha-beta](#) with [quiescence search](#) and [evaluation](#) based on [piece-square tables](#), InmiChess saw the light of day in 1998, subsequent versions were further improved by a [transposition table](#), [null move pruning](#), [razoring](#), and various [extensions](#) . In 1999, after exchanging ideas with [Steffen A. Jakob](#), author of [Hossa](#), Werner tried [bitboards](#) to implement more effective [pattern recognition](#) for a more sophisticated [evaluation](#), but soon changed back to [mailbox](#) <sup>[2]</sup>. Since version 2.17 released in August 1999, InmiChess was able to probe [Nalimov Tablebases](#) <sup>[3]</sup>.
